

## THE 2021 YOUNG MATHEMATICAL STORY AUTHOR (YMSA) COMPETITION

THE CINDY NEUSCHWANDER AWARD  
(THE 12-15 YEARS OLD CATEGORY)

### SHORTLISTED

'How to Calculate Travel Distance & Time' by Hannah Hunt (13 years old)  
at Dulwich College Beijing (China)

You can read the author's inspiration for the story and the judges' comments

How to calculate travel distance & time

By Hannah Hunt DCB

Are we there yet?

Cover

One day Max was sitting on the sofa watching the TV when the phone started ringing

Max picked up the phone wondering who it could be

Hello  
Hello  
I was wondering if you wanted to go to the fair with all our other friends

That would be lovely  
I will be there in 10 minutes

Max was very excited to go to the fair

Max arrived at Jim's house and knocked on his door

All his friends were waiting inside for him

I have a question  
How long is it going to take us to get to the fair  
I don't know, let's go ask my Mum

Mum! How long is it going to take us to get there?  
I don't know Jim how about you and your friends go and find out

And that is exactly what they did. They got a map of the town, a piece of string, a couple pieces of paper, a few pencils

and a ruler so they could figure it out.

Firstly they got the map and drew out

all the different paths they could take.

Then they had to

figure out the formula.

I know we learnt in Maths that to find distance you do  $speed \times time$

But we are trying to find time so we have to do  $time = \frac{distance}{speed}$

Now that we know the formula, how do we use the formula to find out how long it is going to take us?

Good Question.

I know, we use a piece of string and lay it on the path, then convert cm to km and use the formula.

They looked at the map to see the conversion

50 cm = 50 km

The map said that 1 cm = 1 km so 50 cm = 50 km

time =  $\frac{50 \text{ km}}{? \text{ kmph}}$

Now all they needed was the speed limit of all the towns main roads. How were they going to find it?

Page 3

I knew!! I went to the dentist and saw a sign saying 40 kmph.

$$\text{time} = \frac{50 \text{ km}}{40 \text{ kmph}}$$

$$= 1.25$$

Together, they put the equation into the calculator. They got 1.25. That can't be right can it 1.25 hours. Makes no sense.

Now they knew all they needed to know. They could finally work out the first road.

$$75 \text{ mins} = \frac{1}{4} \text{ of } \textcircled{L}$$

$$25 = \frac{1}{4} \text{ OF } 100$$

$$\frac{50 \text{ km}}{40 \text{ kmph}} = 1 \text{h } 15 \text{ mins}$$

I know, the 1 of 7.25 = 60 mins so if 15 =  $\frac{1}{4}$  of 60 mins and 25 =  $\frac{1}{4}$  of 100 Then the 0.25 must = 15 mins Then we add it all together.

So, if the 1 = 60 mins and the 0.25 = 15 mins then 50 km ÷ 40 kmph should = 1h 15 minutes

# Yay

Wow! They had done it, they had figured out how long it would take them to get to the fair if they took the first road. They were all proud of each other.

Page 4

- Road 1
- Road 2
- Road 3

Now they had completed the first road they only had to calculate 2 more roads to see with one they should take to the fair.

They repeated each step starting with putting the string on the map.

They then measured that string using a ruler. It measured 25 cm.

$$25 \text{ cm} = 25 \text{ km}$$

If the string was 25 cm and 1cm = 1km then the length of the road would be 25km.

$$\frac{25 \text{ km}}{40 \text{ kmph}}$$

Now they have to divide distance by speed.

They had to convert it into minutes. If  $0.75 = \frac{3}{4}$  then 45 minutes must be the answer.

$$0.75 = \frac{3}{4}$$

$$45 \text{ min} = \frac{3}{4}$$

so sully typed  $25 \div 40$  into the calculator but, before they got the answer there was one more step.

- Road 1
- Road 2
- Road 3

Road 1 = 1h 15 mins  
Road 2 = 45 mins

Page 5

They did it again they had figured out how long it would take them if they took Road 2.

The < goes to the smaller one

Road 1 < Road 2

Road 2 ? Road 3

Between

Road 1 and Road 2, Road 2 would be the better road to take, but they still

had to calculate Road 3

to find the best Road to take.

They repeated the steps again. They put the map on the slope and measured it.

= 1.5

$$60 \div 40 = 1.5$$

but

$$60 \text{ km} \div 40 \text{ kmph} =$$

1h 30 mins

Road 1 < Road 2

Road 2 > Road 3

Road 2

The string measured 60 cm wide = 60 km. They typed the equation into the calculator.

Now they have to put 1.5 into minutes. 1.5 = 1 h 30 minutes.

Finally they figured out which road took the shortest amount of time. Road 2 was the best.

After they finished the calculations Jim ran into the kitchen to show his mum all the work he had done. He showed

her that they used the equation  $\text{time} = \frac{\text{distance}}{\text{speed}}$ . Then he showed her one times of all the roads.

$$\text{Time} = \frac{\text{Distance}}{\text{Speed}}$$

Road 1 = 1h 15 min  
Road 2 = 45 min  
Road 3 = 1h 30 min

Road 1 < Road 2  
Road 2 > Road  
Road 2 is  
the quickest

Finally he showed her which road would be the best road to take. She was impressed and proud of them for finding out which road they should take to the fair.

Now they could set off for the fair using road 2 to get there since this road would insure they would have more time to enjoy having fun on the rides.

They got into the car and set off for the trip. Max and his friends had the best time at the fair.

The End

In

this story  
you will

learn about 5 animal  
friends that use a map  
and a piece of string to  
calculate how long it is  
going to take them to get  
to the fair.
